

#### EXECUTIVE OFFICE OF THE PRESIDENT OFFICE OF MANAGEMENT AND BUDGET WASHINGTON, D.C. 20503

August 27, 2021

M-21-31

MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

Shalanda D. Yang FROM: Shalanda D. Young Acting Director

SUBJECT: Improving the Federal Government's Investigative and Remediation Capabilities Related to Cybersecurity Incidents

Recent events, including the SolarWinds incident, underscore the importance of increased government visibility before, during, and after a cybersecurity incident. Information from logs on Federal information systems<sup>1</sup> (for both on-premises systems and connections hosted by third parties, such as cloud services providers (CSPs)) is invaluable in the detection, investigation, and remediation of cyber threats.

Executive Order 14028, *Improving the Nation's Cybersecurity*,<sup>2</sup> directs decisive action to improve the Federal Government's investigative and remediation capabilities. This memorandum was developed in accordance with and addresses the requirements in section 8 of the Executive Order for logging, log retention, and log management, with a focus on ensuring centralized access and visibility for the highest-level enterprise security operations center (SOC) of each agency. In addition, this memorandum establishes requirements for agencies<sup>3</sup> to increase the sharing of such information, as needed and appropriate, to accelerate incident response efforts and to enable more effective defense of Federal information and executive branch departments and agencies.

#### Section I: Maturity Model for Event Log Management

This memo establishes a maturity model to guide the implementation of requirements across four Event Logging (EL) tiers, as described in Table 1 below.

<sup>&</sup>lt;sup>1</sup> As used in this memorandum, "Federal information system" has the meaning given in Executive Order 14028.

<sup>&</sup>lt;sup>2</sup> Available at <u>https://www.federalregister.gov/d/2021-10460</u>

<sup>&</sup>lt;sup>3</sup> As used in this memorandum, "agency" has the meaning given in 44 U.S.C. § 3502. The requirements established by this memorandum do not apply to national security systems, as defined in Executive Order 14028.

Event Logging Tiers	Rating	Description		
EL0	Not Effective	Logging requirements of highest criticality are either not		
	Effective	met or are only partially met		
EL1	Basic	Only logging requirements of highest criticality are met		
EL2	Intermediate	Logging requirements of highest and intermediate criticality are met		
EL3	Advanced	Logging requirements at all criticality levels are met		

Table 1: Summary of Event Logging Tiers

These tiers will help agencies prioritize their efforts and resources so that, over time, they will achieve full compliance with requirements for implementation, log categories, and centralized access. Agencies should also prioritize their compliance activities by focusing first on high-impact systems and high value assets (HVAs).

# *Tier EL0, Rating – Not Effective*

The agency or one or more of its components have <u>**not**</u> implemented the following requirement:

• Ensuring that the Required Logs categorized as Criticality Level 0 are retained in acceptable formats for specified timeframes, per technical details described in Appendix C (*Logging Requirements – Technical Details*).

# Tier EL1, Rating – Basic

The agency and all of its components meet the following requirements, as detailed in Table 2 (*EL1 Basic Requirements*) within Appendix A (*Implementation and Centralized Access Requirements*):

- Basic Logging Categories
- Minimum Logging Data
- Time Standard
- Event Forwarding
- Protecting and Validating Log Information
- Passive DNS
- Cybersecurity Infrastructure Security Agency (CISA) and Federal Bureau of Investigations (FBI) Access Requirements
- Logging Orchestration, Automation, and Response Planning
- User Behavior Monitoring Planning
- Basic Centralized Access

### *Tier EL2, Rating – Intermediate*

The agency and all of its components meet the following requirements, as detailed in Table 3 (*EL2 Intermediate Requirements*) within Appendix A (*Implementation and Centralized Access Requirements*):

- Meeting EL1 maturity level
- Intermediate Logging Categories
- Publication of Standardized Log Structure
- Inspection of Encrypted Data
- Intermediate Centralized Access

# *Tier EL3, Rating – Advanced*

The agency and all its components meet the following requirements, as detailed in in Table 4 (*EL3 Advanced Requirements*) within Appendix A (*Implementation and Centralized Access Requirements*):

- Meeting EL2 maturity level
- Advanced Logging Categories
- Logging Orchestration, Automation, and Response Finalizing Implementation
- User Behavior Monitoring Finalizing Implementation
- Application Container Security, Operations, and Management
- Advanced Centralized Access

# Section II: Agency Implementation Requirements

Agencies must immediately begin efforts to increase performance in accordance with the requirements of this memorandum. Specifically, agencies must:

- Within 60 calendar days of the date of this memorandum, assess their maturity against the maturity model in this memorandum and identify resourcing and implementation gaps associated with completing each of the requirements listed below. Agencies will provide their plans and estimates to their OMB Resource Management Office (RMO) and Office of the Federal Chief Information Officer (OFCIO) desk officer.
- Within one year of the date of this memorandum, reach EL1 maturity.
- Within 18 months of the date of this memorandum, achieve EL2 maturity.
- Within two years of the date of this memorandum, achieve EL3 maturity.
- Provide, upon request and to the extent consistent with applicable law, relevant logs to the Cybersecurity and Infrastructure Security Agency (CISA) and Federal Bureau of Investigation (FBI). This sharing of information is critical to defend Federal information systems.
- Share log information, as needed and appropriate, with other Federal agencies to address cybersecurity risks or incidents.

# Section III: Government-Wide Responsibilities

The following agencies bear specialized responsibilities as part of government-wide efforts to improve the management and use of logging practices:

### CISA is responsible for the following actions:

- Deploying teams to advise agencies in their assessment of logging capabilities.
- Developing and publishing tools, in coordination with the FBI, to help agencies facilitate their assessment of logging maturity across the organization.

*The Department of Commerce is responsible for the following actions:* 

- Continuing to maintain National Institute of Standards and Technology (NIST) Special Publication (SP) 800-92,<sup>4</sup> *Guide to Computer Security Log Management*, in coordination with CISA and the FBI.
- Incorporating the requirements of this memorandum regarding logging, log retention, and log management in the next revision of SP 800-92 and other relevant publications.

### Section IV: Policy Assistance

Address all questions or inquiries regarding this memorandum to the OMB Office of the Federal Chief Information Officer (OFCIO) via email: <u>ofcio@omb.eop.gov</u>.

Appendix A:	Implementation and Centralized Access Requirements
Appendix B:	Definitions
Appendix C:	Logging Requirements – Technical Details

<sup>&</sup>lt;sup>4</sup> Available at <u>https://csrc.nist.gov/publications/detail/sp/800-92/final</u>

### **Appendix A: Implementation and Centralized Access Requirements**

Table 2: EL1 Basic Requirements				
Basic Logging Categories	Ensuring that Required Logs categorized as Criticality Level 0 are retained in acceptable formats for specified timeframes, per technical details described in Appendix C.			
Minimum Logging Data	At a minimum, agencies shall ensure that each event log contains the following data, if applicable:			
	• Properly formatted and accurate timestamp (see below for Time Standard Requirements)			
	• Status code for the event type			
	• Device identifier (MAC address <sup>5</sup> or other unique identifier)			
	Session / Transaction ID			
	Autonomous System Number			
	• Source IP (IPv4)			
	• Source IP (IPv6)			
	• Destination IP (IPv4)			
	• Destination IP (IPv6)			
	Status Code			
	Response Time			
	• Additional headers (i.e., HTTP headers)			
	• Where appropriate, the username and/or userID shall be included			
	• Where appropriate, the command executed shall be included			
	• Where possible, all data shall be formatted as key-value-pairs allowing for easy extraction			
	<ul> <li>Where possible, a unique event identifier shall be included for event correlation; a unique event identifier shall be defined per event type<sup>6</sup></li> </ul>			

Table 2: EL1 Basic Requirements

<sup>&</sup>lt;sup>5</sup> Agencies should configure all hosts to have MAC randomization turned off. Where possible, this configuration should be maintained automatically.

<sup>&</sup>lt;sup>6</sup> Software developed by agencies or by contractors on behalf of agencies must log unique event identifiers for each event in accordance with these requirements.

Time Standard	<ul> <li>Consistent timestamp formats across all event logs are necessary for accurate and efficient event correlation and log analysis. Timestamps must be applied consistently to logs from all computing devices, routers, switches, and servers. Agencies shall maintain log timestamps in a format that meets the following requirements, based on both ISO 8601 and RFC 3339: Date and Time on the Internet: Timestamps.<sup>7</sup></li> <li>YYYY-MM-DDThh:mm:ss.mmmZ (Zulu time, UTC+0) and</li> <li>YYYY = four-digit year</li> <li>MM = two-digit month</li> <li>DD = two-digit day of the month</li> <li>T = a set character indicating the start of the time element</li> <li>hh = two digits of an hour (00 through 23)</li> <li>mm = two digits of a second</li> <li>mmm = three digits of a millisecond (000 through 999)</li> </ul>
	<ul> <li>+ - = time zone designator (Z or +hh:mm or -hh:mm), the + or – values indicate how far ahead or behind a time zone is from the UTC (Coordinated Universal Time) zone.</li> </ul>
	Agencies shall use a GPS master station clock as a baseline reference for timestamps used for logs and systems producing logs. If GPS reference is not possible, agencies shall use NIST's authenticated time service. <sup>8</sup> Public, unauthenticated, and unencrypted NTP pools shall only be used as an option of last resort, and only for as long as needed to begin leveraging other options.
Event Forwarding	Event Forwarding allows administrators to obtain events from remote computers, also called source computers or forwarding computers, and store them on a central server known as the collector computer. Agencies shall forward all required logging data, in near real- time <sup>9</sup> and on an automated basis, to centralized systems responsible for security, information, and event monitoring (SIEM); bulk storage; and other

<sup>&</sup>lt;sup>7</sup> Software developed by agencies or by contractors on behalf of agencies must log timestamps for each event in accordance with these requirements. If the software does not produce data in this format, Federal agencies will transform records to conform to these standards before the data is ingested into the SIEM or stored in bulk storage.
<sup>8</sup> <u>https://www.nist.gov/pml/time-and-frequency-division/time-services/nist-authenticated-ntp-service</u>

<sup>&</sup>lt;sup>9</sup> The term "near real-time" or "nearly real-time" (NRT) refers to the time delay introduced by automated data processing or network transmission between the occurrence of an event and the use of the processed data, such as for display or feedback and control purposes.

	analytical workflows or services. Data must be encrypted in transit between its source and destination. Agencies must ensure the original log can be replayed for future use.
Protecting and Validating Log Information	To ensure data integrity, logging facilities and log information must be protected by cryptographic methods from tampering and unauthorized access. Agencies shall protect and monitor the integrity of their logs and systems producing logs by:
	<ul> <li>Verifying that event logging is enabled and active for system components. <ul> <li>Traps shall be put in place to monitor these data streams for disruption.</li> <li>These traps shall be monitored.</li> </ul> </li> <li>Ensuring that only individuals who have a job-related need can view, access, or modify log files.</li> <li>Documenting views and usage of log files and regularly reviewing/auditing the resulting records.</li> <li>Confirming that current log files are protected from unauthorized modifications via access control mechanisms, such as virtual or physical segregation.</li> <li>Ensuring that current log files are promptly backed up to an authorized source, such as a centralized log server or write-once media.</li> <li>Using integrity-verification mechanisms to detect unauthorized changes to event logging configuration and log files that are no longer being written to or are considered closed.</li> <li>Conducting integrity checks periodically and upon access against the log hashes throughout their retention period.</li> <li>When logging stops unexpectedly, audit alerts shall be sent in near real-time to any parties responsible for monitoring. The responsible party must promptly investigate the cause of the disruption and take appropriate corrective actions.</li> <li>Monitoring across the enterprise for unexpected changes to files or configuration items, including changes to: <ul> <li>Credentials</li> <li>Privileges and security settings</li> <li>Content</li> <li>Core attributes and size</li> <li>Hash values</li> <li>Configuration values</li> </ul> </li> </ul>
Passive DNS	<ul> <li>Federal agencies shall implement a Domain Name System (DNS)</li> <li>logging system that meets the requirements identified in Appendix C,</li> <li>including DNS requests made over encrypted DNS connections.</li> <li>Agencies shall implement accompanying analytics that allow for rapid</li> <li>identification of the host that sourced each DNS query. This capability</li> </ul>

	shall be monitored and triaged. Federal agencies shall automate the production of a list of hostnames that are frequently accessed or looked up by legitimate users within their agency, but are not included in general top domain lists identified by CISA or available publicly or via subscription. Agencies should make that list automatically accessible to CISA or submit it to CISA daily via an acceptable automated mechanism.
CISA and FBI Access Requirements	Agencies shall provide logs and other relevant data to CISA and the FBI upon request, to the extent consistent with applicable law, including 44 U.S.C. § 3553(1). Agencies shall provide such data in a format and by means agreed upon by the agency, CISA, or the FBI, and shall do so pursuant to timelines specified by CISA or the FBI. Those timelines may require near real-time access to data.
Logging Orchestration, Automation, and Response – Planning	Federal agencies shall maintain and manage logs by leveraging the additional logging to develop automated hunt and incident response playbooks. Such playbooks shall take advantage of Security, Orchestration, Automation, and Response (SOAR) capabilities. Agencies at EL1 stage shall start planning on how to best implement SOAR capabilities in their environment. For additional implementation requirements, please see Table 4, <i>EL3 Advanced Requirements, Logging Orchestration, Automation, and Response – Finalizing Implementation</i> .
User Behavior Monitoring – Planning	User behavioral analytics allow for early detection of malicious behavior. This technology leverages machine learning and artificial intelligence techniques to detect anomalous user actions and help combat advanced threats. Agencies at EL1 stage shall start planning on how to best implement a user behavior analytics capability in their environment, leveraging the logging requirements, in order identify potentially malicious or malicious activity. Agencies are expected to finalize their implementation of this capability to achieve EL3 maturity level. For additional implementation requirements, please see Table 4, <i>EL3 Advanced Requirements, User Behavior Monitoring – Finalizing Implementation.</i>
Basic Centralized Access	Logs should be centrally aggregated by an agency component-level Enterprise Log Manager (ELM). Traps for detecting data-stream disruption should be monitored by the component-level SOC. The DNS logging system and accompanying analytics shall be monitored and triaged by the component-level SOC.

Table 3: EL2 Intermediate Requirements

EL1 maturity level	All requirements for EL1 must be met.
Intermediate Logging Categories	Required Logs categorized as Criticality Level 1 and 2 must be retained in acceptable formats for specified timeframes, per technical details described in Appendix C.
Publication of Standardized Log Structure	For all software developed by or on behalf of Federal agencies that produces logs and is deployed in Federal environments, Federal agencies shall provide a document detailing the structure (schema) for those logs to CISA. Agencies shall refer to guidance from CISA in developing this documented schema. Federal agencies shall also provide all updates to the schema to CISA no later than one business day after they are finalized. The schema and associated documentation shall be published to Data.gov.
Inspection of Encrypted Data	Federal agencies shall retain and store in cleartext form the data or metadata from Appendix C that is collected in their environment. If agencies perform full traffic inspection through active proxies, they should log additional available fields as described in Appendix C and can work with CISA to implement these capabilities. If agencies do not perform full traffic inspection, they should log the metadata available to them. In general, agencies are expected to follow zero-trust principles concerning least privilege and reduced attack surface, and relevant guidance from OMB and CISA relating to zero-trust architecture.
Intermediate Centralized Access	<ul> <li>Required Logs categorized as Criticality Levels 0 and 1 are accessible and visible for the highest-level security operations at the head of each agency. Required Logs categorized as Criticality Levels 2 are retained, at a minimum, at component level.</li> <li>Traps for detecting data-stream disruption should be monitored by the component-level and top-level enterprise SOCs. The DNS logging system and accompanying analytics shall be monitored and triaged by the component-level and top-level enterprise SOCs. The enterprise SOC shall ensure that cross-organizational analytics are established for use across agency components.</li> </ul>

EL2 maturity level	All requirements for EL2 must be met.
Advanced Logging Categories	Required Logs categorized as Criticality Level 3 must be retained in acceptable formats for specified timeframes, per technical details described in Appendix C.
Logging Orchestration,	Agencies shall finalize and implement automated hunt and incident response playbooks. Federal agencies shall also provide any updates to

# Table 4: EL3 Advanced Requirements

Automation, and Response – Finalizing Implementation	the playbooks and automation integrations to CISA no later than one business day after they are finalized.
User Behavior Monitoring – Finalizing Implementation	<ul> <li>User behavioral analytics must be implemented in order to allow for early detection of malicious behavior. This technology leverages machine learning and artificial intelligence techniques to detect anomalous user actions and help combat advanced threats. Agencies shall implement a user behavior analytics capability, leveraging the logging requirements, in order identify potentially malicious or malicious activity. This capability shall monitor all user and non-user accounts. This capability shall be monitored and triaged by component-and top-level agency Security Operations Centers (SOC). At a minimum, user Behavior Monitoring should be configured to detect and alert on:</li> <li>Compromised user credentials</li> <li>Privileged-user compromise</li> <li>Improper asset access</li> <li>Compromised system/host/device</li> <li>Lateral movement of threat actor</li> </ul>
Application Container Security, Operations, and Management	Container security and monitoring tools should be integrated with security information and event management (SIEM) tools to ensure container-related events are captured by the enterprise. Alternatively, in cases where the uses and privileges of containers are appropriately constrained by the orchestration layer, agencies may rely on SIEM tools present at that layer. In general, Federal agencies shall ensure that their cyber hunt and incident response teams have appropriate tools and training to identify incidents within a containerized environment. <sup>10</sup>
Advanced Centralized Access	Required Logs across all criticality levels shall be accessible to the highest-level security operations at the head of each agency.

<sup>&</sup>lt;sup>10</sup> Reference NIST SP 800-191, Application Container Security Guide; https://csrc.nist.gov/publications/detail/sp/800-190/final

# **Appendix B: Definitions**

The definitions for the fields in Appendix C are as follows:

**Log Category** – This column describes the various log categories from which logging data can be sourced. The table in Appendix C is organized by log category for ease of use.

**Required Data** – This column describes the information that agencies must collect within each log category.

**Format** – This column describes the acceptable formats for the required data. See below for definitions of the various formats that can appear in this column.

- Attachment An attachment is a file sent via email.
- **Config** A CONFIG file is a configuration file used by various applications. It contains plain-text parameters that define settings or preferences for building or running a program.
- **Database record** A database record is a set of database fields.
- **Database query** A database query is a request to access data from a database. Capturing the query allows for playback so that Hunt and IR teams can identify what data was exfiltrated or inserted.
- File A file is a resource for recording data in a storage device.
- Log A log file contains data about an event that occurred in an application or operating system.
- **Packet capture** Packet capture (PCAP) results from the interception and copying of a data packet that is crossing or moving over a specific computer network.
- Script A script file is a configuration file that lets users run or execute certain actions.
- Simple Network Management Protocol (SNMP) SNMP exposes management data in the form of variables on the managed systems organized in a management information base (MIB), which describe the system status and configuration. These variables can then be remotely queried (and, in some circumstances, manipulated) by managing applications.

**Application monitoring dashboard** – An application monitoring dashboard provides information about the metrics, usage, and performance of an application. Agencies should use a dashboard suited to the version, type, and deployment method of each application.

**Criticality** – Each log category has an assigned criticality level based on its relative cybersecurity value. This cybersecurity value relates to the usefulness of the log data for threat detection, with the most useful data assigned a criticality of zero, and the least a criticality of 3.

Active storage – Refers to data that is stored in a manner that facilitates frequent use and ease of access.

**Cold data storage** – refers to the storage of data in a manner that minimizes costs while still allowing some level of access and use. Agencies should leverage architectures defined in NIST 800-92 to ensure that data stored in this manner is properly secured and audited.

- **EMM** Enterprise Mobility Management
- **UEM** Unified Endpoint Management
- $\mathbf{MTD}$  Mobile Threat Defense
- MDM Mobile Device Management
- **IMEI** International Mobile Equipment Identity
- IMSI International Mobile Subscriber Identity

# **Appendix C: Logging Requirements – Technical Details**

Exceptions to requirements set below:

- Full packet capture data is required to be stored for only 72 hours.
- The retention periods prescribed below are minimum values; agencies may retain data for longer periods if appropriate.

Log	Required Data	Format	Criticalit	Retention
Category	-		У	Period
